

Economical inverter with simple operation

NE-S1 Series **NEW**

What's "NES"?

New Inverter
Small, Simple

N Next & New
NEXT generation inverter opens the door to NEW market segments

E Ecological & Economical
ECOLOGICAL - saves energy
ECONOMICAL - simple to install and easy to use

1 Space Saving

Among the smallest form-factors in their category:
-43% smaller than equivalent X200 (0.2 kW)
-Side-by-side installation to save panel space

* Side-by-side installation: derating for carrier frequency and output current required

2 Simple Operation

Run/Stop/Reset is integrated in one button for simple operation.
Full-function attachable operator available as an option. (refer to p.15)

3 Global Standards

- Conformity to global standards
Conforms to CE/UL/c-UL/c-Tick
- Compatible to both sink and source logic as standard
Logic input is compatible with both sink and source logic.

5 Optional Customization

Customization for specific applications is available. (contact Hitachi)

4 For Network

- RS485 Modbus-RTU Communication port is standard

developed by Hitachi
and Economical

S Small&Simple

SIMPLE functions in a SMALL package

6 Inherent Functions to achieve energy savings

Automatic energy saving function is implemented to minimize energy consumption.

- **Arithmetic and delay functions**
Arithmetic operation and delay functions can simplify external hardware.
- **Keypad / Terminal switching**
Source of frequency and run commands can be selected via intelligent terminal.
- **2nd motor function**
Settings for 1st and 2nd motor can be selected via intelligent input.
- **Three-wire Operation function**
Momentary contact for RUN and STOP can be utilized.
- **Analog Input Disconnection Detect Function**
When wire for analog signal to command frequency is cut, pre-assigned signal can be output.

*Parameter change and setting by keypad etc.

7 Application

Optimal performance for energy saving applications such as fans and pumps

Fan and air conditioners
·air conditioning systems
·fans and blowers
·clean rooms

Pumps
·water and wastewater pump systems
·tank-less water supply and drainage systems

Food Processing Machines
·slicers ·mixers
·confectionery machines
·Fruit Sorters

General Specifications

Item		General Specifications	
Control	Control method	Line-to-line sine wave pulse-width modulation (PWM) control	
	Output frequency range *5	0.5 to 400Hz	
	Frequency accuracy *6	Digital command :±0.01%, Analog command±0.2% (25±10°C)	
	Frequency setting resolution	Digital: 0.1Hz, Analog: (max frequency)/1000	
	Voltage/Frequency Characteristic	V/f control, V/f variable (constant torque, reduced torque)	
	Acceleration/deceleration time	0.00 to 3000 sec. (linear, sigmoid), two-stage accel./decel.	
	Starting torque *7	100%/6Hz	
	Carrier frequency range	2.0 to 15kHz	
Input terminal	Protective functions	Over-current, Over-voltage, Under-voltage, Overload, Overheat, Ground fault at power-on, Input over-voltage, External trip, Memory error, CPU error, USP error, Driver error, Output phase loss protection	
	Specification	10kohm input impedance, sink/source logic selectable	
Output signal	Functions	FW(Forward), RV(Reverse), CF1-CF3(Multispeed command), JG(Jogging), DB(External DC braking), SET(Second motor constants setting), 2CH(Second accel./decel.), FRS(Free-run stop), EXT(External trip), USP(Unattended start protection), SFT(Software lock), AT(Analog input selection), RS(Reset), STA(3-wire start), STP(3-wire stop), F/R(3-wire fwd./rev.), PID(PID On/Off), PIDC(PID reset), UP/DWN(Remote-controlled accel./decel.), UDC(Remote-controlled data clearing), OPE(Operator control), SF1-SF3(multispeed bit), OLR(overload restriction selection), LAC(LAD cancellation), ADD(ADD frequency enable), F-TM(force terminal mode), KHC(cumulative power clearance), AHD(analog command holding), HLD(retain output frequency), ROK(permission of run command), DISP (display limitation), NO(Not selected)	
	Intelligent output terminal	Specification	27V DC 50mA max open collector output, 1 terminals 1c output 250V AC/30V DC 2.5A relay (AL0, AL1, AL2 terminals)
Operator	Moniter output terminal	Function	RUN(run signal), FA1(Frequency arrival type 1 - constant speed), FA2(Frequency arrival type 2 - over-frequency), OL(overload advance notice signal), OD(Output deviation for PID control), AL(alarm signal), DC(Wire brake detect on analog input), FBV(PID Second Stage Output), NDC(ModBus Network Detection Signal), LOG(Logic Output Function), ODC(analog voltage input disconnection), LOC(Low load), FA3(Set frequency reached), UV(Under voltage), RNT(Operation time over), ONT(Plug-in time over), THM(Thermal alarm signal), ZS(0 Hz detection signal), IRDY(Inverter ready), FWR(Forward rotation), RVR(Reverse rotation), MJA(Major failure)
	Operation key	Function	PWM output; Select analog output frequency monitor, analog output current monitor or digital output frequency monitor
Operation	Status LED Interface	Operation key	1 unified key for RUN/STOP/RESET ON : this key has function of "RUN"(regardless run command source setting (A002/A201).) OFF : this key has function of "STOP/RESET" When optional operator is connected, operation from key is disabled.
		Status LED Interface	Control power supply LED (Red),LED during operation (yellow-green),Operation button operation LED (yellow-green),LED during tripping (Red), 4LED in total
	Frequency setting	Operator keypad(Optional)	Up and Down keys / Value settings or analog setting via potentiometer on operator keypad
		External signal *8	0 to 10 V DC or 4 to 20 mA
	FW/RV Run	Serial port	RS485 interface (Modbus RTU)
		Operator Keypad(Optional)	Run key / Stop key (change FW/RV by function command)
Environment	External signal	FW Run/Stop (NO contact), RV set by terminal assignment (NC/NO), 3-wire input available	
	Serial port	RS485 interface (Modbus RTU)	
Other functions	Operating temperature	-10 to 50°C(carrier derating required for aambient temperature higher than 40°C), no freezing	
	Storage temperature	-20 to 60°C	
	Humidity	20 to 90% RH	
	Vibration	5.9mm/s ² (0.6G) 10 to 55Hz	
Options	Location	Altitude 1,000 m or less, indoors (no corrosive gasses or dust)	
	Other functions	AVR (Automatic Voltage Regulation), V/f characteristic selection, accel./decel. curve selection, frequency upper/lower limit, 8 stage multispeed, PID control, frequency jump, external frequency input bias start/end, jogging, trip history etc.	
Options		Remote operator with copy function (WOP), Remote operator (OPE-SRmini, OPE-SR), Operator (NES1-OP), input/output reactors, DC reactors, radio noise filters, LCR filter, communication cables (ICS-1, 3)	

Note 1: The applicable motor refers to Hitachi standard 3-phase motor (4-pole). When using other motors, care must be taken to prevent the rated motor current (50/60 Hz) from exceeding the rated output current of the inverter.

Note 2: The output voltage decreases as the main supply voltage decreases (except when using the AVR function). In any case, the output voltage cannot exceed the input power supply voltage.

Note 3: The braking torque via capacitive feedback is the average deceleration torque at the shortest deceleration (stopping from 50/60 Hz as indicated). It is not continuous regenerative braking torque. The average decel torque varies with motor loss. This value decreases when operating beyond 50 Hz.

Note 4: The protection method conforms to JEM 1030.

Note 5: To operate the motor beyond 50/60 Hz, consult the motor manufacturer for the maximum allowable rotation speed.

Note 6: The output frequency may exceed the maximum frequency setting (A004 or A204) for automatic stabilization control.

Note 7: At the rated voltage when using a Hitachi standard 3-phase, 4pole motor.

Note 8: DC 4 to 20 mA input, need parameter setting by Keypad etc.

Analog input voltage or current can be switched by switch as individually and not use them in the same time.

Dimensions

Inches for reference only

NES1-007SB, NES1-015SB, NES1-022SB, NES1-015LB, NES1-022LB

Operation and Programming

The NE-S1 series can be easily operated with the digital operator provided as standard. Change and setting parameter by Keypad (NES1-OP). The digital operator can also be detached and used for remote-control. An operator with copy function is also available as an option.

<NE-S1 Standard Operator Panel>

<Exclusive use Operator Panel (Option)>

Terminal function

	Terminal name	Description	Ranges and Notes
Input/monitor signals	FM	Monitor terminal (frequency, current, etc.)	PWM out put(0 to10V DC, 1mA max.)
	L	Common for inputs	-
	P24	+24V for logic inputs	24V DC, 30mA (do not short to terminal L)
	PLC	Intelligent input common	-
	5	Intelligent (programmable) input terminals, selection from: FW(Forward), RV(Reverse), CF1-CF3(Multispeed command), JG(Jogging), DB(External DC braking), SF1-SF3(multispeed bit), SET(Second motor constants setting), 2CH(Second accel./decel.), FRS(Free-run stop), EXT(External trip), USP(Unattended start protection), SFT(Software lock), RS(Reset), STA(3-wire start), STP(3-wire stop), F/R(3-wire fwd./rev.), PID(PID On/Off), PIDC(PID reset), OLR(overload restriction selection), UP/DWN(Remote-controlled accel./decel.), UDC(Remote-controlled data clearing), OPE(Operator control), ADD(Frequency setpoint), F-TM(Force terminal enable), RDY(Quick start enable),KHC(cumulative power clearance), AHD(analog command holding), HLD(retain output frequency), ROK(permission of run command), DISP (display limitation) or NO(Not selected).	 Operated by closing switch. (Input logic is selectable)
Frequency setting	H	+10V analog reference	10V DC, 10mA max
	O/OI	Analog input, voltage/ Analog input, current Switch able by switch but not use them in the same time.	 0 to 10V DC, input impedance10kohm 4 to 20mA DC, input impedance 250ohm
	L	Common for inputs	-
Output signals	11	Intelligent (programmable) output terminals, selection from: RUN(run signal), FA1(Frequency arrival type 1 -constant speed), FA2(Frequency arrival type 2 -over-frequency), OL(overload advance notice signal), OD(Output deviation for PID control), AL(alarm signal), FA3(Set frequency reached), UV(Under voltage), RNT(Operation time over), ONT(Plug-in time over), DC(Wire brake detect on analog input), FBV(Feedback voltage comparison), NDC(analog voltage input disconnection), LOG(Logic operation result), ODC(Option Card Detection signal), LOC(Low Load Detection).	Open collector output L level at operation (ON) 27V DC, 50mA max.
	CM2	Common for intelligent output terminals	-
Relay output	AL2	Relay contact (alarm output) terminals (programmable, function is selectable same as intelligent output terminals).	 <Initial setting> Normal: AL0-AL1 closed Trip/Power OFF: AL0-AL2 closed
	AL1		
	AL0		
			AC250V 2.5A (Resistive load) 0.2A (cosφ=0.4) DC30V 3.0A (Resistive load) 0.7A (cosφ=0.4) (minimum) AC100V 10mA DC 5V 100mA

Protective Functions

Error Codes (Standard)

The ALM (red) of the main body, LED indication of RUN (yellowish green) display it like a list shown below at the time of error outbreak.

Error contents	LED Lighting, Blinking	
	Alarm LED	Run LED
Over-current event	Lighting	Blinking
Over-voltage	Blinking Same period	Blinking Same period
Under-voltage	Blinking Alternation	Blinking Alternation
Overload	Lighting	Lighting
Major failure*1	Lighting	Lights out
Others	Blinking	Lights out

Note 1) The Major fault: When a memory error, CPU error, Ground fault, Output phase loss protection error and Driver error.
 Note 2) The blinking is a period for 1s.

Error Codes (Operator)

Name	Cause(s)	Display on digital operator	
Over current	The inverter output was short-circuited, or the motor shaft is locked or has a heavy load. These conditions cause excessive current for the inverter, so the inverter output is turned OFF.	While at constant speed	E01
		During deceleration	E02
		During acceleration	E03
		Others	E04
Overload protection *1	When a motor overload is detected by the electronic thermal function, the inverter trips and turns OFF its output.	E05	
Over voltage protection	When the DC bus voltage exceeds a threshold, due to regenerative energy from the motor.	E07	
Memory error *2,3	When the built-in memory has problems due to noise or excessive temperature, the inverter trips and turns OFF its output to the motor.	E08	
Under-voltage error	A decrease of internal DC bus voltage below a threshold results in a control circuit fault. This condition can also generate excessive motor heat or cause low torque. The inverter trips and turns OFF its output.	E09	
Current detection error	If an error occurs in the internal current detection system, the inverter will shut off its output and display the error code.	E10	
CPU error	A malfunction in the built-in CPU has occurred, so the inverter trips and turns OFF its output to the motor.	E11 E22	
External trip	A signal on an intelligent input terminal configured as EXT has occurred. The inverter trips and turns OFF the output to the motor.	E12	
USP *4	When the Unattended Start Protection (USP) is enabled, an error occurred when power is applied while a Run signal is present. The inverter trips and does not go into Run Mode until the error is cleared.	E13	
Ground fault *5	The inverter is protected by the detection of ground faults between the inverter output and the motor during powerup tests. This feature protects the inverter, and does not protect humans.	E14	
Input over-voltage	When the input voltage is higher than the specified value, it is detected 100 seconds after powerup and the inverter trips and turns OFF its output.	E15	
Inverter thermal detection system error	When the cooling fin thermal sensor in the inverter detect disconnection etc, inverter trips.	E19	
Inverter thermal trip	When the inverter internal temperature is above the threshold, the thermal sensor in the inverter module detects the excessive temperature of the power devices and trips, turning the inverter output OFF.	E21	
Control circuit error	When abnormality occurred on a control circuit board, I make a error code	E26	
Driver error	An internal inverter error has occurred at the safety protection circuit between the CPU and main driver unit. Excessive electrical noise may be the cause. The inverter has turned OFF the IGBT module output.	E30	
Output phase loss protection	Output Phase Loss Logic Detection (There are undetectable terms of use.)	E34	
Low-speed overload protection	If overload occurs during the motor operation at a very low speed, the inverter will detect the overload and shut off the inverter output.	E38	
Operator connection failure	When the connection between inverter and operator keypad failed, inverter trips and displays the error code.	E40	
Communications error	The inverter's watchdog timer for the communications network has timed out.	E41	

Note 1: Reset operations acceptable 10 seconds after the trip. Note 2: If an memory error (E08) occurs, be sure to confirm the parameter data values are still correct.
 Note 3: Memory error may occur at power-on after shutting down the power while copying data with remote operator or initializing data. Shut down the power after completing copy or initialization.
 Note 4: USP error occurs at resetting trip after under-voltage error (E09) if USP is enabled. Reset once more to recover.
 Note 5: Ground fault error (E14) cannot be released with resetting. Shut the power and check wiring.
 Note 6: When error E08 error, it may be required to perform initialization.

How to access the details about the present fault

Note: Indicated inverter status could be different from actual inverter behavior. (e.g. When PID operation or frequency given by analog signal, although it seems constant speed, acceleration and deceleration could be repeated in very short cycle.)

Connecting Diagram

Source type logic

Note 1: Common terminals are depend on logic.

Terminal	1,2,3,4,5	H,O/OI	11
Common	P24	L	CM2

Note 2: Please choose proper inverter input volotage rating.

Note 3: Voltage input: 0 to 10V and current input: 0 to 20mA
(change parameter to move 4 to 20mA current input).

O and OI is common input terminal (O / OI terminal) change voltage / current input by switch.

Connecting Diagram

Sink type logic

Note 1: Common terminals are depend on logic.

Terminal	1,2,3,4,5,H,O/OI	11
Common	L	CM2

Note 2: Please choose proper inverter input volotage rating.

Note 3: Voltage input: 0 to 10V and current input: 0 to 20mA
(change parameter to move 4 to 20mA current input).

O and OI is common input terminal (O / OI terminal) change voltage / current input by switch.

Wiring and Accessories

Input Voltage	Motor Output (kW/HP)	Model	Wiring		Signal Lines	Fuse		Fuse					
			Power Lines			Type	Rated	Type	Rated				
			AWG	mm ²									
1-phase 200V	0.2(1/4)	NES1-002SB	AWG16	1.3	0.75mm ² shielded wire	Class J, CC,G or T	Inverse Time	10A	15A				
	0.4(1/2)	NES1-004SB	AWG16	1.3									
	0.75(1)	NES1-007SB	AWG12	3.3									
	1.5(2)	NES1-015SB	AWG10	5.3									
	2.2(3)	NES1-022SB	AWG10	5.3									
3-phase 200V	0.2(1/4)	NES1-002LB	AWG16	1.3			0.75mm ² shielded wire	Class J, CC,G or T		Inverse Time	10A	5A	
	0.4(1/2)	NES1-004LB	AWG16	1.3									
	0.75(1)	NES1-007LB	AWG16	1.3									
	1.5(2)	NES1-015LB	AWG14	2.1								15A	15A
	2.2(3)	NES1-022LB	AWG12	3.3									
					20A	20A							

Note 1: Field wiring connection must be made by a UL and c-UL listed closed-loop terminal connector sized for the wire gauge involved. Connector must be fixed using the crimping tool specified by the connector manufacturer.
 Note 2: Be sure to use large wire gauges for power wiring if the distance exceeds 20m (66ft).
 Note 3: Use 0.75mm² /18 AWG wire for the relay terminals (AL0, AL1 and AL2) signal wire.

Name	Function
Input side AC reactor	This is useful in suppressing harmonics induced on the power supply lines, or when the main power voltage imbalance exceeds 3% (and power source capacity is more than 500kVA), or to smooth out line fluctuations. It also improves the power factor.
Radio noise filter	Electrical noise interference may occur on nearby equipment such as a radio receiver. This magnetic choke filter helps reduce radiated noise (can also be used on output).
EMC filter	Reduces the conducted noise on the power supply wiring generated by the inverter. Connect to the inverter input side.
Radio noise filter (Capacitor filter)	This capacitor filter reduces radiated noise from the main power wires in the inverter input side.
DC link choke	Suppresses harmonics generated by the inverter.
Output side noise filter	Reduces radiated noise from wiring in the inverter output side.
Radio noise filter	Electrical noise interference may occur on nearby equipment such as a radio receiver. This magnetic choke filter helps reduce radiated noise (can also be used on input).
AC reactor	This reactor reduces the vibration in the motor caused by the inverter's switching waveforms, by smoothing the waveforms to approximate commercial power quality. It is also useful when wiring from the inverter to the motor is more than 10m in length, to reduce harmonics.
LCR filter	Sine wave shaping filter for the output side.

Operator, Cable

Operator

Model	Potentiometer	Remote Control	Copy function
NES1-OP	○		
OPE-SR mini	○	○	
OPE-SBK		○

Torque characteristics

Torque characteristics

<p>ISO 14001 EC97J1095</p>   	<p>Hitachi variable frequency drives (inverters) in this brochure are produced at the factory registered under the ISO 14001 standard for environmental management system and the ISO 9001 standard for inverter quality management system.</p>
<p>ISO 9001 JQA-1153</p>	

For Correct Operation

Application to Motors

Application to general-purpose motors

Operating frequency	The overspeed endurance of a general-purpose motor is 120% of the rated speed for 2 minutes (JIS C4,004). For operation at higher than 60Hz, it is required to examine the allowable torque of the motor, useful life of bearings, noise, vibration, etc. In this case, be sure to consult the motor manufacturer as the maximum allowable rpm differs depending on the motor capacity, etc.
Torque characteristics	The torque characteristics of driving a general-purpose motor with an inverter differ from those of driving it using commercial power (starting torque decreases in particular). Carefully check the load torque characteristic of a connected machine and the driving torque characteristic of the motor.
Motor loss and temperature increase	The torque characteristics of driving a general-purpose motor with an inverter differ from those of driving it using commercial power
Noise	When run by an inverter, a general-purpose motor generates noise slightly greater than with commercial power.
Vibration	When run by an inverter at variable speeds, the motor may generate vibration, especially because of (a) unbalance of the rotor including a connected machine, or (b) resonance caused by the natural vibration frequency of a mechanical system. Particularly, be careful of (b) when operating at variable speeds a machine previously fitted with a constant speed motor. Vibration can be minimized by (1) avoiding resonance points using the frequency jump function of the inverter, (2) using a tire-shaped coupling, or (3) placing a rubber shock absorber beneath the motor base.
Power transmission mechanism	Under continued, low-speed operation, oil lubrication can deteriorate in a power transmission mechanism with an oil-type gear box (gear motor) or reducer. Check with the motor manufacturer for the permissible range of continuous speed. To operate at more than 60Hz, confirm the machine's ability to withstand the centrifugal force generated.

Application to special motors

Gear motor	The allowable rotation range of continuous drive varies depending on the lubrication method or motor manufacturer. (Particularly in case of oil lubrication, pay attention to the low frequency range.)
Brake-equipped motor	For use of a brake-equipped motor, be sure to connect the braking power supply from the primary side of the inverter.
Pole-change motor	There are different kinds of pole-change motors (constant output characteristic type, constant torque characteristic type, etc.), with different rated current values. In motor selection, check the maximum allowable current for each motor of a different pole count. At the time of pole changing, be sure to stop the motor. Also see: Application to the 400V-class motor.
Submersible motor	The rated current of a submersible motor is significantly larger than that of the general-purpose motor. In inverter selection, be sure to check the rated current of the motor.
Explosion-proof motor	Inverter drive is not suitable for a safety-enhanced explosion-proof type motor. The inverter should be used in combination with a pressure-proof explosion-proof type of motor. *Explosion-proof verification is not available for NE-S1 Series.
Synchronous (MS) motor High-speed (HFM) motor	In most cases, the synchronous (MS) motor and the high-speed (HFM) motor are designed and manufactured to meet the specifications suitable for a connected machine. As to proper inverter selection, consult the manufacturer.
Single-phase motor	A single-phase motor is not suitable for variable-speed operation by an inverter drive. Therefore, use a three-phase motor.

Application to the 400V-class motor

A system applying a voltage-type PWM inverter with IGBT may have surge voltage at the motor terminals resulting from the cable constants including the cable length and the cable laying method. Depending on the surge current magnification, the motor coil insulation may be degraded. In particular, when a 400V-class motor is used, a longer cable is used, and critical loss can occur, take the following countermeasures:

- (1) install the LCR filter between the inverter and the motor,
- (2) install the AC reactor between the inverter and the motor, or
- (3) enhance the insulation of the motor coil.

Notes on Use

Drive

Run/Stop	Run or stop of the inverter must be done with the keys on the operator panel or through the control circuit terminal. Do not operate by installing an electromagnetic contactor (MC) in the main circuit.
Emergency motor stop	When the protective function is operating or the power supply stops, the motor enters the free run stop state. When an emergency stop is required or when the motor should be kept stopped, use of a mechanical brake should be considered.
High-frequency run	A max. 400Hz can be selected on the NE-S1 Series. However, a two-pole motor can attain up to approx. 24,000 rpm, which is extremely dangerous. Therefore, carefully make selection and settings by checking the mechanical strength of the motor and connected machines. Consult the motor manufacturer when it is necessary to drive a standard (general-purpose) motor above 60Hz. A full line of high-speed motors is available from Hitachi.

About the load of a frequent repetition use

About frequent repetition use (crane, elevator, press, washing machine), a power semiconductor (IGBT, a rectification diode, thyristor) in the inverter may come to remarkably have a short life by heat exhaustion. The life can be prolonged by lower a load electric current. Lengthen acceleration / deceleration time. Lower carrier frequency. or increasing capacity of the inverter.

About the use in highlands beyond 1,000m above sea level

When the standard inverter is used at a place beyond 1,000m above sea level because it cool heating element with air, please be careful as follows. But please inquire for the highlands more than 2,500m separately.

1. Reduction of the inverter rating current
The density of air decreases by 1% whenever rising by 100m when the altitude exceeds 1000m. For example, in the case of 2,000m above sea level, it is {2,000(m) -Because it becomes 1,000(m)/100(m) X {-1(%)}} =-10(%), please use with 10(%) reduction (0.9* inverter rating electric current) of a rating current of the inverter.
2. Reduction of the breakdown voltage
When using inverter at a place beyond 1,000m, the breakdown voltage decreases as follows. 1,000m or less:1.00/1,500m:0.95/2,000m:0.90/2,500m:0.85. But please do not perform the withstand pressure test as mention of the instruction manual.

Installation location and operating environment

Avoid installation in areas of high temperature, excessive humidity, or where moisture can easily collect, as well as areas that are dusty, subject to corrosive gasses, mist of liquid for grinding, or salt. Install the inverter away from direct sunlight in a well-ventilated room that is free of vibration. The inverter can be operated in the ambient temperature range from -10 to 50°C. (Carrier frequency and output current must be reduced in the range of 40 to 50°C.)

Main power supply

<p>Installation of an AC reactor on the input side</p>	<p>In the following examples involving a general-purpose inverter, a large peak current flows on the main power supply side, and is able to destroy the converter module. Where such situations are foreseen or the connected equipment must be highly reliable, install an AC reactor between the power supply and the inverter. Also, where influence of indirect lightning strike is possible, install a lightning conductor.</p> <p>(A) The unbalance factor of the power supply is 3% or higher. (Note) (B) The power supply capacity is at least 10 times greater than the inverter capacity (the power supply capacity is 500 kVA or more). (C) Abrupt power supply changes are expected.</p> <p>Examples: (1) Several inverters are interconnected with a short bus. (2) A thyristor converter and an inverter are interconnected with a short bus. (3) An installed phase advance capacitor opens and closes.</p> <p>In cases (A), (B) and (C), it is recommended to install an AC reactor on the main power supply side. Note: Example calculation with $V_{RS} = 205V$, $V_{ST} = 201V$, $V_{TR} = 200V$ V_{RS} : R-S line voltage, V_{ST} : S-T line voltage, V_{TR} : T-R line voltage</p> $\text{Unbalance factor of voltage} = \frac{\text{Max. line voltage (min.)} - \text{Mean line voltage}}{\text{Mean line voltage}} \times 100$ $= \frac{V_{RS} - (V_{RS} + V_{ST} + V_{TR})/3}{(V_{RS} + V_{ST} + V_{TR})/3} \times 100 = \frac{205 - 202}{202} \times 100 = 1.5(\%)$
<p>Using a private power generator</p>	<p>An inverter run by a private power generator may overheat the generator or suffer from a deformed output voltage waveform of the generator. Generally, the generator capacity should be five times that of the inverter (kVA) in a PWM control system, or six times greater in a PAM control system.</p>

Notes on Peripheral Equipment Selection

<p>Wiring connections</p>	<p>(1) Be sure to connect main power wires with R(L1), S(L2), and T(L3) terminals (input) and motor wires to U(T1), V(T2), and W(T3) terminals (output). (Incorrect connection will cause an immediate failure.) (2) Be sure to provide a grounding connection with the ground terminal (⊕).</p>
<p>Electromagnetic contactor</p>	<p>When an electromagnetic contactor is installed between the inverter and the motor, do not perform on-off switching during running operation.</p> <p>When used with standard applicable output motors (standard three-phase squirrel-cage four-pole motors), the NE-S1 Series does not need a thermal relay for motor protection due to the internal electronic protective circuit. A thermal relay, however, should be used:</p> <ul style="list-style-type: none"> • during continuous running outside a range of 30 to 60 Hz. • for motors exceeding the range of electronic thermal adjustment (rated current). • when several motors are driven by the same inverter; install a thermal relay for each motor. • The RC value of the thermal relay should be more than 1.1 times the rated current of the motor. Where the wiring length is 10 m or more, the thermal relay tends to turn off readily. In this case, provide an AC reactor on the output side or use a current sensor.
<p>Installing a circuit breaker</p>	<p>Install a circuit breaker on the main power input side to protect inverter wiring and ensure personal safety. Choose an inverter-compatible circuit breaker. The conventional type may malfunction due to harmonics from the inverter. For more information, consult the circuit breaker manufacturer.</p>
<p>Wiring distance</p>	<p>The wiring distance between the inverter and the remote operator panel should be 20 meters or less. Shielded cable should be used on the wiring. Beware of voltage drops on main circuit wires. (A large voltage drop reduces torque.)</p>
<p>Earth leakage relay</p>	<p>If the earth leakage relay (or earth leakage breaker) is used, it should have a sensitivity level of 15 mA or more (per inverter).</p>
<p>Phase advance capacitor</p>	<p>Do not use a capacitor for power factor improvement between the inverter and the motor because the high-frequency components of the inverter output may overheat or damage the capacitor.</p>

High-frequency Noise and Leakage Current

- (1) High-frequency components are included in the input/output of the inverter main circuit, and they may cause interference in a transmitter, radio, or sensor if used near the inverter. The interference can be minimized by attaching noise filters (option) in the inverter circuitry.
- (2) The switching action of an inverter causes an increase in leakage current. Be sure to ground the inverter and the motor.

Lifetime of Primary Parts

Because a DC bus capacitor deteriorates as it undergoes internal chemical reaction, it should normally be replaced every five years. Be aware, however, that its life expectancy is considerably shorter when the inverter is subjected to such adverse factors as high temperatures or heavy loads exceeding the rated current of the inverter. The approximate lifetime of the capacitor is as shown in the figure at the right when it is used 12 hours daily (according to the "Instructions for Periodic Inspection of General-Purpose Inverter" (JEMA).) Also, such moving parts as a cooling fan should be replaced. Maintenance inspection and parts replacement must be performed by only specified trained personnel. Please plan to replace new INV depends on the load, ambient condition in advance.

Precaution for Correct Usage

- Before use, be sure to read through the Instruction Manual to insure proper use of the inverter.
- Note that the inverter requires electrical wiring; a trained specialist should carry out the wiring.
- The inverter in this catalog is designed for general industrial applications. For special applications in fields such as aircraft, outer space, nuclear power, electrical power, transport vehicles, clinics, and underwater equipment, please consult with us in advance.
- For application in a facility where human life is involved or serious losses may occur, make sure to provide safety devices to avoid a serious accident.
- The inverter is intended for use with a three-phase AC motor. For use with a load other than this, please consult with us.
